Lab Sheet - 3

§1. The differential equation is given by

$$\frac{dy}{dx} = x\,y \quad \text{with} \quad y = 5 \quad \text{at} \quad x = 1.$$

Find the solution, using the following methods, in the interval $[1, 2]$ using step size $\Delta x = 0.1$.

(i) Euler method , (ii) RK-2 method , and (iii) RK-4 method.
Plot the behavior of y as a function of x.

§2. The differential equation is given by

$$\frac{dy}{dt} = y - t^2 + 1 \quad \text{with} \quad y = 0.5 \quad \text{at} \quad t = 0$$

(i) Using RK-4 method calculate y for $0 \leq t \leq 2$ using $\Delta t = 0.1$. Plot the behavior of y as a function of t.
(ii) If the analytical solution of the above differential equation is $y = t^2 + 2t + 1 - (1/2)e^t$ then estimate the error, i.e. the difference between the analytical and numerical result, at each time step. Plot the error as a function of t.
